Photoacoustic Imaging Sources

Photoacoustic imaging employs the physical property of molecules to briefly heat up and cool down while absorbing a short pulse of light of a certain wavelength

Photoacoustic imaging is one of the fastest-growing research areas of non-invasive, high-resolution and high-contrast visualization of both superficial and deep tissues.

This method has a number of advantages over widely used conventional research and diagnostic methods as unlike X-ray, it does not use hazardous irradiation and has a significantly higher imaging resolution compared to conventional ultrasound . Photoacoustic imaging is proven to be very effective in diagnosing breast tumors, skin cancer, thyroid nodules, osteoarthritis and rheumatoid arthritis, early diagnosis of blood vessel disorders and many more. Photoacoustic imaging can also be used for visualization of non-living objects, such as nondestructive inspection of the internal structure and property changes of composite materials and food inspection.

Photoacoustic imaging employs the physical property of molecules to briefly heat up and cool down while absorbing a short pulse of light (couple of nanoseconds) of a certain wavelength. While heating up, molecules expand and while cooling down, they contract. This creates an ultrasound wave which can be captured by ultrasound transducers enabling the ability to locate the origin of sound. The penetration of light into tissue depends on the tissue properties and the pulse energy of the light. Moreover, different chromophores in the tissue can absorb light of different wavelengths, thus giving functional visual information.

Photoacoustic Imaging Sources

diode pumped

mobile

table-top

Utilizing many years of experience in the development and production of tunable wavelength, high energy lasers, EKSPLA introduced PhotoSonus series laser sources, which were designed to be used in advanced photoacoustic imaging systems. These laser sources have a wide wavelength range of 660 – 2300 nm, up to 250 mJ of pulse energy and the capability of fiber coupling of the output beam. This makes them a perfect choice for any photoacoustic imaging system for irradiating different tissues and a range of other materials.

Flash-lamp pumped PhotoSonus M laser systems combine a pump laser, OPO and power supply unit into a single mobile cart unit. Having the highest pulse energy of up to 250 mJ this is a perfect laser source for pre-clinical photoacoustic research equipment.

Diode-pumped PhotoSonus X is a low maintenance, high repetition rate (up to 100 Hz) and low noise laser system. Combining an optional internal energy meter and electromechanical shutter with laser self-test capability, this laser is certification-ready for both pre-clinical and clinical use.

A unique, fast-wavelength switching option enables each laser pulse to have a different wavelength in almost any sequence. This could be very useful while tracking changes in molecular properties within a short time period.

Flash-lamp pumped high-energy table-top PhotoSonus T series tunable wavelength laser systems can be used in research labs as a standalone OPO system as well as an irradiation source for photoacoustic imaging systems.

High Output Power DPSS Tunable Laser for Photoacoustic Imaging

PhotoSonus X

PhotoSonus X is a perfect solution for photoacoustic imaging in pre-clinical and clinical use and when fast sample scanning is required.

Having high output energy of up to 90 mJ at the peak, a broad wavelength tuning range from 650 to 2600 nm, high pulse repetition rate up to 100 Hz and fast wavelength switching makes it a perfect photoacoustic imaging source for gaining high-resolution images and ensuring high data acquisition rate. Moreover, being built on a diode pumped solid-state laser platform, PhotoSonus X assures significantly quieter operation (< 60 dB) compared with flash-lamp pumped lasers, which is very beneficial for clinical use.

Diode pumped laser technology and well-engineered system design ensures high reliability and low-cost system operation. PhotoSonus X output can be coupled with almost any type of fiber bundle.

With additional options of an internal energy meter and electromechanical shutter with laser self-test capability, PhotoSonus X can be ready for certification in clinical photoacoustic applications.

Features

- Ultra-wide signal tuning range from **650** to **1300 nm**
- Fully motorized wavelength tuning
- Fast wavelength switching
- Externally triggerable
- High, up to **90 mJ** pulse energy from OPO
- **100 Hz** or **50 Hz** pulse repetition rate
- Certification ready
- Quiet operation **< 60 dB**
- Integrated DPSS pump laser and OPO into a single housing
- Fiber bundle or fiber
- Signal and idler through the same output (optional)
- Integrated energy meter (optional)
- Electromechanical output shutter with laser self-test capability

650 – 1300 nm / 90 mJ / < 60 dB

PhotoSonus M

See list of publications written by employing **PhotoSonus** series lasers

EKSPLA Savanoriu Av. 237, LT-02300 Vilnius, Lithuania | Ph. +370 5 2649629 | e-mail: sales@ekspla.com | **www.ekspla.com** Rev. 20230328

High Energy, Mobile, Tunable Wavelength Laser Source for Photoacoustic Imaging

PhotoSonus M

Following the demand for high output energies in the photoacoustic market for imaging larger volumes of tissue, PhotoSonus M, an updated high energy tunable laser source for photo-acoustic imaging, was introduced.

Time-tested Ekspla nanosecond pump laser, parametric oscillator, power supply and cooling unit are integrated in a single robust housing to provide mobility, ease of use and low maintenance cost. The highly flexible PhotoSonus M platform makes it easily integrated and used in a photoacoustic imaging system. It is fully motorized and computer controlled, with user trigger outputs and inputs and special options such as motorized switching between OPO signal and idler, motorized attenuator, internal energy meter and electromechanical output shutter.

Recently, a fast wavelength switching option was introduced that enables each laser pulse to have a different wavelength within the entire signal or idler range and at any sequence. This new feature, combining high pulse energy (up to 180 mJ) and wide wavelength tuning range (330 – 2300 nm) makes PhotoSonus M the irreplaceable imaging source for any photo acoustic system.

For even higher sample imaging depth and resolution a PhotoSonus M+, with up to 250 mJ maximum pulse energy, was introduced.

For convenience, the outputs of PhotoSonus M and PhotoSonus M+ lasers can be coupled with almost any type of fiber bundle.

Features

- High up to **250 mJ** output energy
- Wide tuning range from **330** to **2300 nm**
- Ultra-wide OPO signal tuning range from **660** to **1320 nm**
- **10 Hz** or **20 Hz** pulse repetition rate
- Integrated pump laser, OPO and PSU in single mobile unit
- Low maintenance cost
- Fiber bundle connectors with safety interlock
- Fast wavelength switching within entire signal or idler range between two consecutive pulses
- Integrated energy meter (optional)
- Motorized attenuator (optional)
- Access to pump laser wavelengths 1064/532 nm (optional)
- Signal and idler through the same output (optional)

330 – 2300 nm / 250 mJ / 10 Hz 20 Hz

PhotoSonus T

BENEFITS

High pulse energy (up to 230 mJ) is highly beneficial for photoacoustics imaging applications

Superior tuning resolution (1 – 2 cm^{-1}) allows recording of high quality spectra

High integration level saves space in the laboratory

Flashlamps replacement without misalignment of the laser cavity saves on maintenance costs

In-house design and manufacturing of complete systems, including pump lasers, guarantees on-time warranty and post warranty services and spares supply

Variety of control interfaces: USB, RS232, optional LAN and WLAN ensures easy control and integration with other equipment

Attenuator and fiber bundle coupling options facilitate incorporation of PhotoSonus T systems into various experimental environments

EKSPLA Savanoriu Av. 237, LT-02300 Vilnius, Lithuania | Ph. +370 5 2649629 | e-mail: sales@ekspla.com | **www.ekspla.com** Rev. 20230328

High Energy Table-Top Tunable Wavelength Lasers for Photoacoustic Imaging

PhotoSonus T

PhotoSonus T series tunable laser seamlessly integrates in a compact housing a nanosecond optical parametric oscillator and Nd:YAG Q-switched laser.

Three models with different output pulse energy values and different repetition rates are offered. The most powerful model has more than 230 mJ pulse energy. Narrow linewidth (<10 cm^{-1}) is nearly constant trough almost whole tuning range, which makes laser suitable for many spectroscopy application.

The device is controlled from the remote keypad or PC using LabVIEW™ drivers that are supplied with the system. The remote pad features a backlit display that is easy to read even while wearing laser safety glasses.

System is designed for easy and cost-effective maintenance. Replacement of flashlamps can be done without misalignment of the laser cavity and deterioration of laser performance. OPO pump energy monitoring system helps to increase lifetime of the optical components.

Options

Optional items are available allowing optimization of the laser system for Your application, for example:

/ Fiber bundle coupled output;

/ Energy meter;

/ Efficient second harmonic generator for 330–660 nm range;

/ Pulse energy attenuator;

/ Water-air cooled power supply.

Please inquire custom-build versions and options.

Features

Hands-free, automated wavelength tuning from **330** to **2600 nm**

Ultra-wide OPO signal tuning range from **660** to **1320 nm**

Up to **230 mJ** in range 660 – 2600 nm, **35 mJ** in range 330 – 660 nm

Narrow linewidth across tuning range

3 – 5 ns pulse duration

Remote control via key pad or PC

Separate output port for 532 nm beam. Output for 1064 nm is optional

OPO pump energy monitoring

Fast wavelength switching within entire signal or idler ranges

Applications

/ Photoacoustic imaging

/ Flash photolysis

/ Photobiology

/ Remote sensing

/ Non-linear spectroscopy

330 – 2600 nm / 230 mJ / 3 – 5 ns
